Problem 1: Energy Estimate

1. Dataset Exploration.

The dataset was read as pandas dataframe using the `pandas.read_excel()` method and the first five columns can be seen in the table below:

| | X1 | X2 | X3 | X4 | X5 | X6 | X7 | X8 | Y1 | Y2 |
|---|------|-------|-------|--------|-----|----|-----|----|-------|-------|
| 0 | 0.98 | 514.5 | 294.0 | 110.25 | 7.0 | 2 | 0.0 | 0 | 15.55 | 21.33 |
| 1 | 0.98 | 514.5 | 294.0 | 110.25 | 7.0 | 3 | 0.0 | 0 | 15.55 | 21.33 |
| 2 | 0.98 | 514.5 | 294.0 | 110.25 | 7.0 | 4 | 0.0 | 0 | 15.55 | 21.33 |
| 3 | 0.98 | 514.5 | 294.0 | 110.25 | 7.0 | 5 | 0.0 | 0 | 15.55 | 21.33 |
| 4 | 0.90 | 563.5 | 318.5 | 122.50 | 7.0 | 2 | 0.0 | 0 | 20.84 | 28.28 |

Figure: First five rows of the dataset

2. Statistical Analysis

Using the `pandas.describe()` method, some intuitive insights could be made about our dataset as seen in the figure below.

| | X1 | X2 | X3 | X4 | X5 | X6 | X7 | X8 | Y1 | Y2 |
|-------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| count | 768.000000 | 768.000000 | 768.000000 | 768.000000 | 768.000000 | 768.000000 | 768.000000 | 768.000000 | 768.000000 | 768.000000 |
| mean | 0.764167 | 671.708333 | 318.500000 | 176.604167 | 5.250000 | 3.500000 | 0.234375 | 2.81250 | 22.307195 | 24.587760 |
| std | 0.105777 | 88.086116 | 43.626481 | 45.165950 | 1.75114 | 1.118763 | 0.133221 | 1.55096 | 10.090204 | 9.513306 |
| min | 0.620000 | 514.500000 | 245.000000 | 110.250000 | 3.500000 | 2.000000 | 0.000000 | 0.00000 | 6.010000 | 10.900000 |
| 25% | 0.682500 | 606.375000 | 294.000000 | 140.875000 | 3.500000 | 2.750000 | 0.100000 | 1.75000 | 12.992500 | 15.620000 |
| 50% | 0.750000 | 673.750000 | 318.500000 | 183.750000 | 5.250000 | 3.500000 | 0.250000 | 3.00000 | 18.950000 | 22.080000 |

| max | 0.980000 | 808.500000 | 416.500000 | 220.500000 | 7.000000 | 5.000000 | 0.400000 | 5.00000 | 43.100000 | 48.030000 |

Figure: Statistical analysis of the dataset

Task 1: Building and Testing a Ridge Predictive Model.

A ridge regression model was built and by using gridsearch, the different parameters of alpha within the :[0.001,0.01,0.1, 1.0, 10.0] were tested.

For both Y1 and Y1 output labels, the optimal value of alpha obtained was

alpha = 0.1

Using the optimal computed alpha parameter, the Mean Absolute Error and Mean Squared Errors using **10-fold 10 repetitions** with randomly chosen data cross-validation strategy were then evaluated for each output label and the results are shown in the table below.

| | Mean of mean Absolute Error Score(MAE) | Standard Deviation of MAE | Mean Square Error Score(MSE) | Standard Deviation of MSE |
|------------|---|---------------------------------|------------------------------------|---------------------------------|
| Y1 - Label | 0.911248 | 0.019398 | 0.911085 | 0.018569 |
| Y2- Label | 0.880110 | 0.024485 | 0.880428 | 0.030050 |

Table: Mean and Standard deviation of MAE and MSE for Ridge Regression using optimal C

Task 2: Building a Random Forest Regressor Model

A Random Forest Regressor model was built and using gridsearch on a combination of parameters, the optimal values for the parameters were found to be:

| Best Hyperparameter Set For GridSearch RandomForest | | |
|---|-----|-----|
| | Y1 | Y2 |
| Number of estimators | 500 | 250 |
| Max_depth | 250 | 250 |
| min_samples_split | 2 | 2 |
| min_samples_leaf: | 1 | 1 |

Table: Best hyperparameters using Grid search with Random Forest Classifier

After computing the mean and standard deviations for both Y1 and Y2 using Ridge regression and RandomForest Regressor models and scoring with Mean squared Error and Mean Absolute error, the eight(8) results obtained are presented in the table below

| Output | Mean Absolute Error | | Mean Squared Error | |
|--------|---------------------|------------------|--------------------|------------------|
| | RandomForest | Ridge Regression | RandomForest | Ridge Regression |
| Y1 | 0.34 ± 0.06 | 2.12 ± 0.27 | 0.28 ± 0.11 | 8.87 ± 1.94 |
| Y2 | 1.06 ± 0.17 | 2.30 ± 0.31 | 3.01 ± 0.92 | 10.67 ± 3.02 |

Table: MAE and MSE for Random Forest and Ridge Regression

Problem 2: Bank Telemarketing

1. Dataset Exploration.

The dataset was read as pandas dataframe using the `pandas.read_csv()` method and the first five columns can be seen in the table below:

| | age | job | marital | education | default | housing | loan | contact | month | day_of_week | ... | campaign | pdays | previous | poutcome | emp.var.rate |
|---|-----|-----------|---------|-------------|---------|---------|------|-----------|-------|-------------|-----|----------|-------|----------|-------------|--------------|

Figure: Statistical analysis of the dataset

3. Conversion of Categorical to Numeric Columns

The dataset had several categorical columns. Unfortunately, machine learning models cannot be trained with such data. Therefore, the columns were transformed to numeric before training the model as can be seen in the image below

| | age | job | marital | education | default | housing | loan | contact | month | day_of_week | ... | campaign | pdays | previous | poutcome | emp.var.rate | cons |
|---|-----|-----|---------|-----------|---------|---------|------|---------|-------|-------------|-----|----------|-------|----------|----------|--------------|------|
| 0 | 56 | 3 | 1 | 0 | 0 | 0 | 0 | 1 | 6 | 1 | ... | 1 | 999 | 0 | 1 | 1.1 | |
| 1 | 57 | 7 | 1 | 3 | 1 | 0 | 0 | 1 | 6 | 1 | ... | 1 | 999 | 0 | 1 | 1.1 | |
| 2 | 37 | 7 | 1 | 3 | 0 | 2 | 0 | 1 | 6 | 1 | ... | 1 | 999 | 0 | 1 | 1.1 | |
| 3 | 40 | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 6 | 1 | ... | 1 | 999 | 0 | 1 | 1.1 | |
| 4 | 56 | 7 | 1 | 3 | 0 | 0 | 2 | 1 | 6 | 1 | ... | 1 | 999 | 0 | 1 | 1.1 | |

5 rows × 21 columns

Figure: categorical to numeric columns

Task 1: Build a Logistic Regression Model

After building a Logistic Regression model with cross-validation use 5-fold cross-validation with 5 repetitions and varying C-hyperparameter with the range of 10^{-4} and 10^4 , a plot mean AUC score vs C parameter was evaluated and presented below

C-values used for training the model = [0.0001,0.0005,0.001,0.005, 0.01, 0.05 ,0.1, 0.5, 1.0, 5, 10.0, 50, 100.0, 250, 500, 1000.0, 2500, 5000, 7500, 10000.0]

The C hyperparameter with the Highest AUC score is **C = 1000.0**

Figure: Graph of Mean AUC Score with Difference values of C-parameters with Logistic Regression Model

Task 2: Build a Random Forest Model

In order to obtain the best combination of parameters that yields the best AUC score, for a random forest classifier, I implemented a Gridsearch with these different hyperparameter values.

The cross-validation in grid search used a cross-validation strategy of **3-fold cross-validation with 3 repetitions**.

| Hyperparameters For GridSearch | |
|--------------------------------|-----------------------------|
| Number of estimators | 10, 50, 100, 250, 500, 1000 |
| Max_depth | 50,150,250 |
| min_samples_split | 2,3 |
| min_samples_leaf: | 1,2,3 |

Best Hyperparameter Set with Best Score

After running the Gridsearch with the above hyperparameter values, the hyperparameter set with the best AUC score was:

| Best Hyperparameter Set For GridSearch | |
|--|---------------------------|
| Number of estimators | 1000 |
| Max_depth | 150 |
| min_samples_split | 3 |
| min_samples_leaf: | 3 |
| Best score | 0.9467143264126682 |

With the best score of

Task 3: Build a Neural Network Model

As specified in the homework document, gridsearch was implemented to find the best score and combination of the following hyperparameters:

hidden_layer_sizes: (10,10,10), (10,10,10,10), (10,10,10,10,10), (10,10,10,10,10,10)

alpha: 0.00001, 0.0001, 0.001, 0.01, 0.1

| Best Hyperparameter Set | |
|-------------------------|------------|
| hidden_layer_sizes | (10,10,10) |
| alpha | 0.1 |
| Best score | 0.94 |

Task 4: Classification Reports

1) Classification Report for Logistic Regression with C = 1
